

## Test Simulation

5 USD buy and Sell commission

Following this Apple (AAPL) graph, obtained from <https://www.worldtradingdata.com>. Where red is a deficit, and green is a profit. Notice the mis predicted drop at 500, 700-800, 2300, 2400-2500.

If we were to make the logic of: buying at the start of the green line, then selling at the end of the green line. Finally, calculating the profits after 30 days.

This is the result we will get. A minimum of 3-4k USD are needed to break even. Flattening out at 15% return.

TODO, do other stock also
